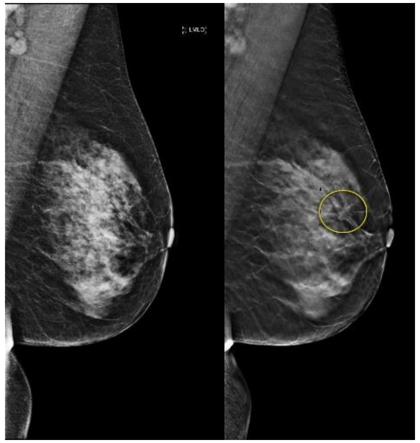
Agenda

- Medical Data Acquisition
- Neural Networks History
- Medical Applications
- Network Exploration
- Summary

Medical Data Acquisition

Medical Imaging – Modality

- Computer Tomography (CT)
- Magnet Resonance Imaging (MRI)
- Positron Emission Tomography (PET)/CT
- Histological Images
- Flow Cytometry, Biomarkers
- Ultrasound
- X-Ray



X-Ray Mammography

First X-Ray - Roentgen

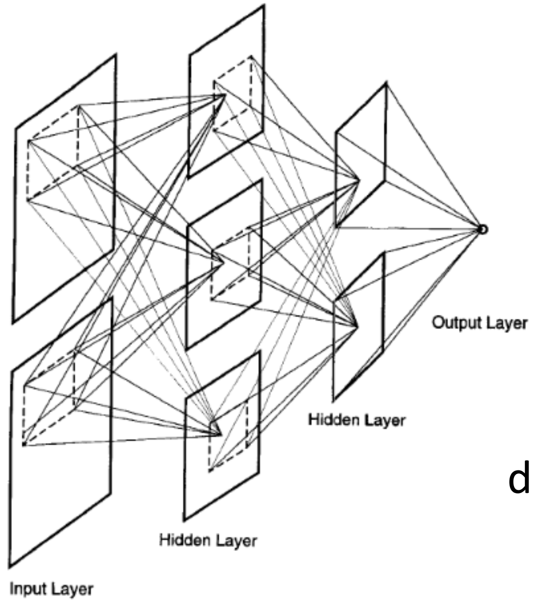
Medical Imaging - Challenges

- Subject specific variances
- Small study populations/datasets
- Developmental differences
- Heterogeneity of pathology
- Treatment response
- Annotation needs experts

Neural Networks History

Neural Networks in Medical Imaging in the Past

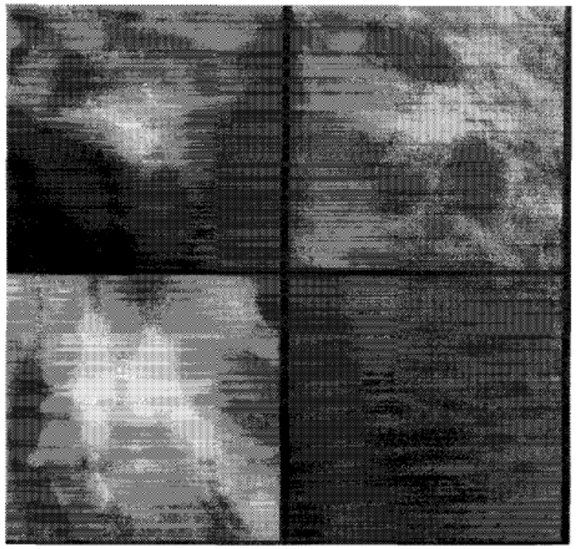
- Convolution neural network (CNN)
  - Lung nodule detection 1993 [2], micro calcification mammography 1995 [3]
  - Classification of breast tissue 1996 [4]



Sahiner et al. 1996 [4]

mass

dense tissue



Mixed dense fatty tissue

Sahiner et al. 1996 [4]

Neural Networks in Medical Imaging Today

- Deep CNN
  - „Computationally expensive“ – acceleration using GPU
  - Highly parallelizable
  - Deep architecture for feature extraction

- Deep CNN Training
  - Large amount of training data and labels
  - Large computational and memory resources
  - Overfitting and convergence as possible complication

Neural Networks in Medical Imaging Today

- Supervised
  - Annotation required
  - Majority of works supervised CNNs
  - Dimensionality of input data (2D, 2.5D, 3D)
  - Application: Segmentation, detection and labeling

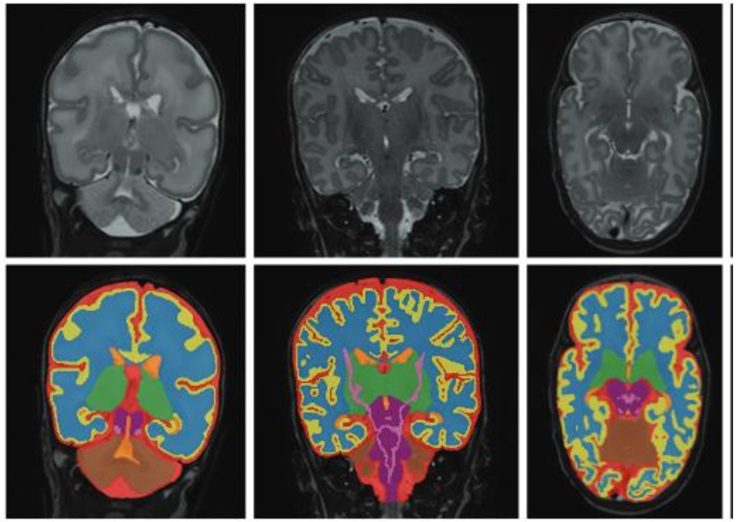

Image from Moeskops et al. [9]

- Unsupervised
  - No annotation required
  - Large computational and memory resources
  - Overfitting and convergence as possible complication
  - Application: Image encoding, representation and preprocessing

Can deep networks be used effectively for medical tasks?

How can we use the training data most efficiently?

Medical Applications

Medical Applications

- Pathology Detection and Computer Aided Diagnoses
- Segmentation and Shape Modelling
- Classification
- Action Recognition

Medical Applications

- Pathology Detection and Computer Aided Diagnoses
- Segmentation and Shape Modelling
- Classification
- Action Recognition

Medical Applications – Pathology Detection

- 2D CNN
  - 2D Patch of image data centered on the location of pathology
  - Setio et al. [5] pulmonary nodules, 3D CT scans of chest,

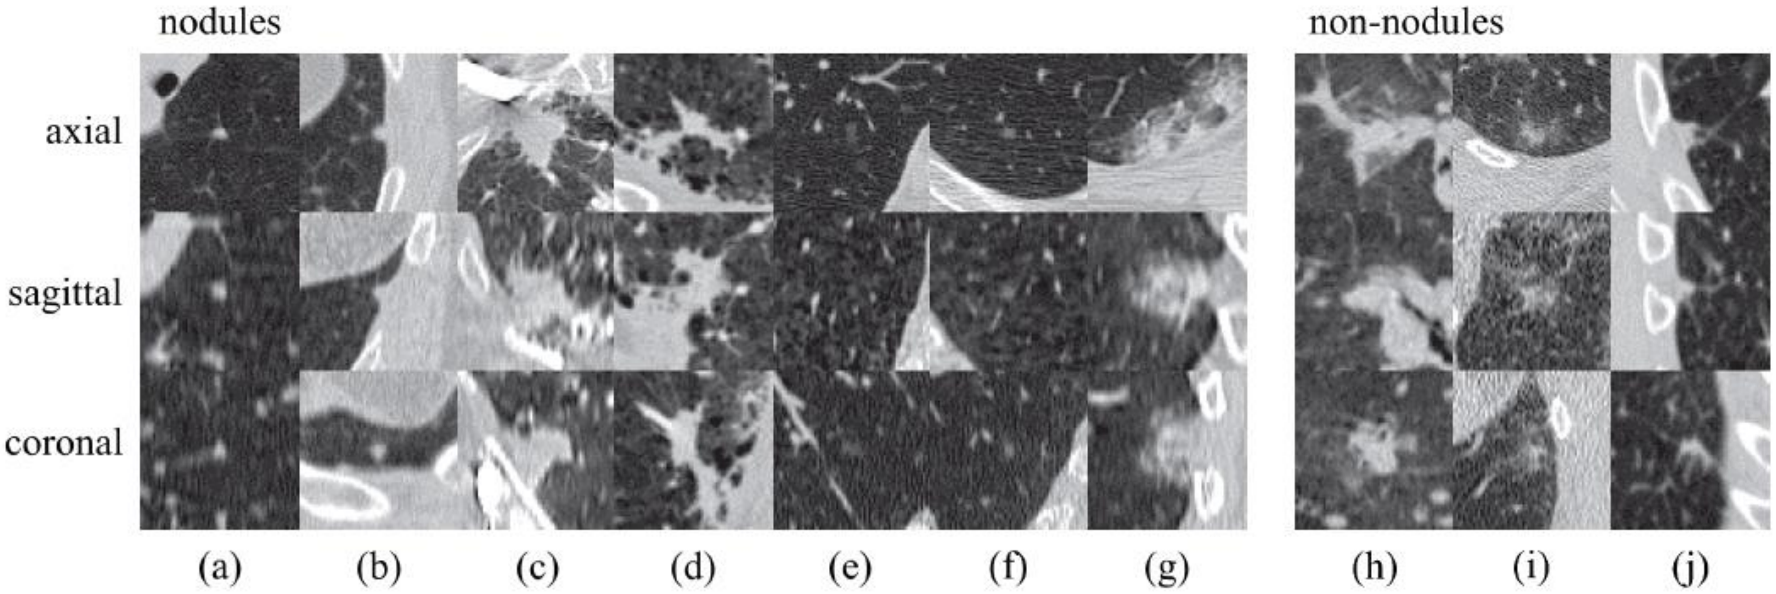

Image taken from Setio et al. [5]

Setio et al. [5], Detection of pulmonary nodules

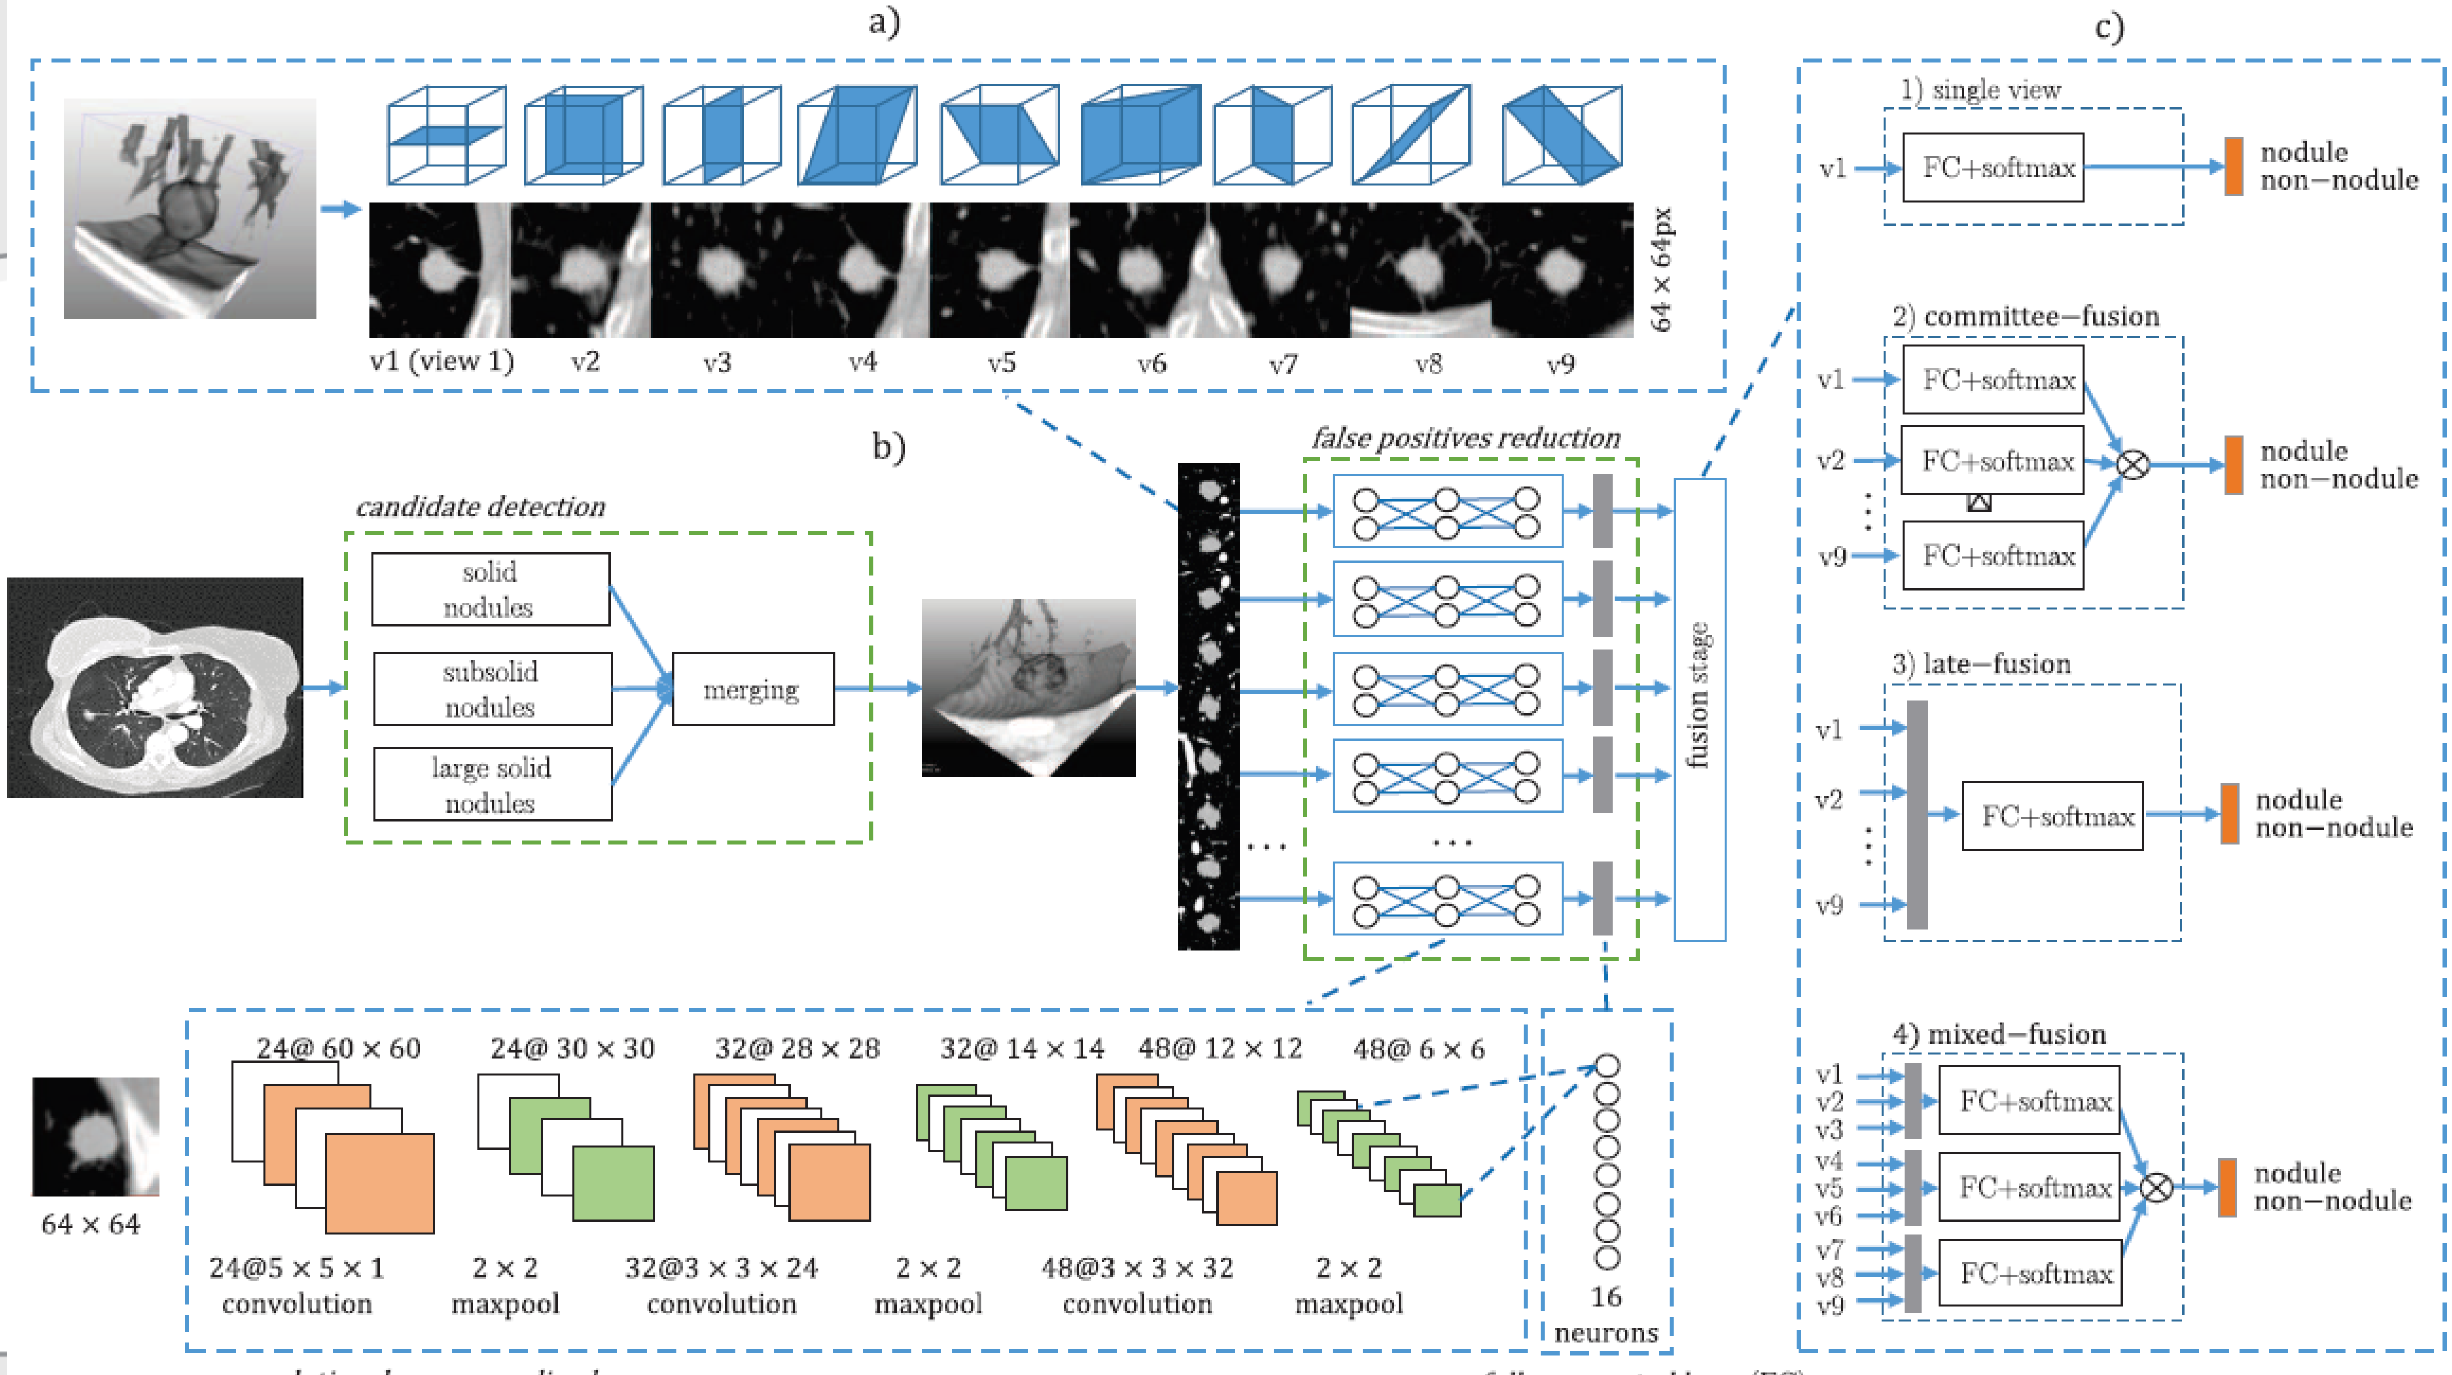

Image taken from Setio et al. [5]

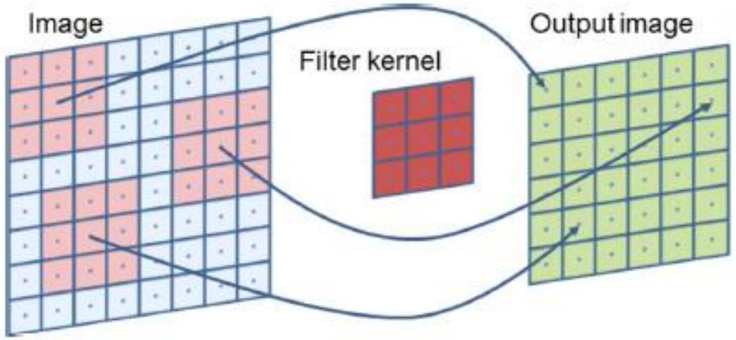
Medical Applications – Pathology Detection

- 2.5 D CNN
  - 3 orthogonal directions
  - 100 Randomly rotated views
  - 13 – 14% increase of sensitivity



Images taken from Roth et al. [6]

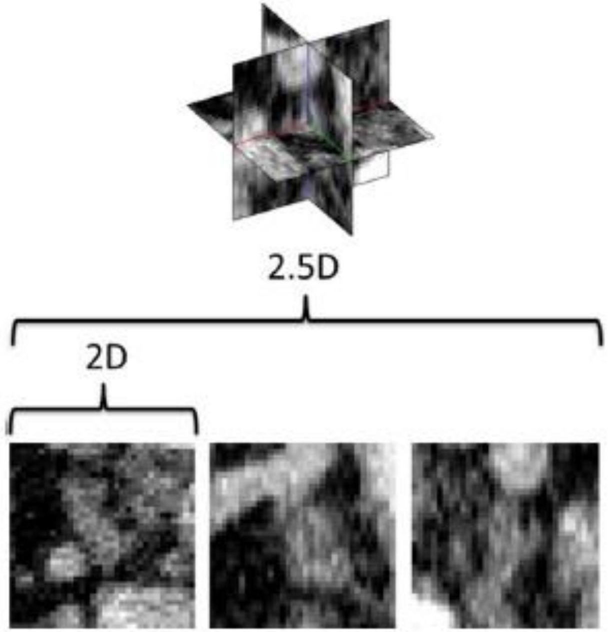


Fig. 4. CADe locations can be either observed as 2D image patches or using a 2.5D approach, that samples the image using three orthogonal views. Here, a lymph node in CT is shown as the input to our method.

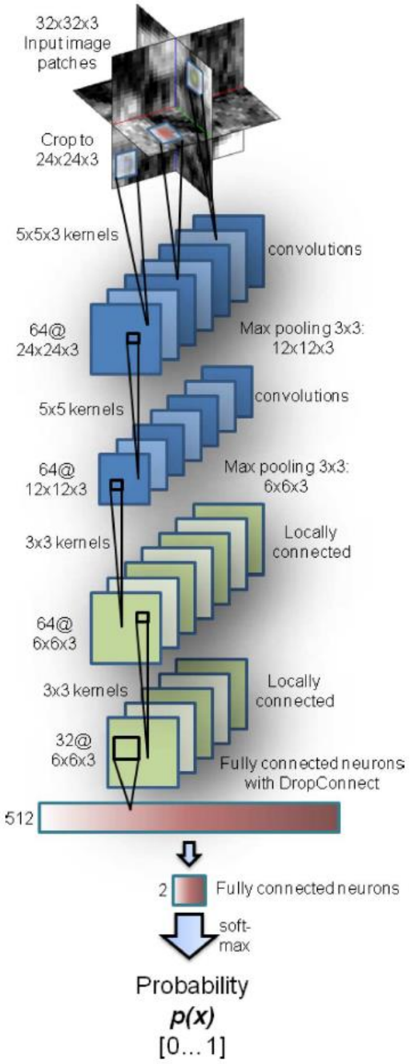
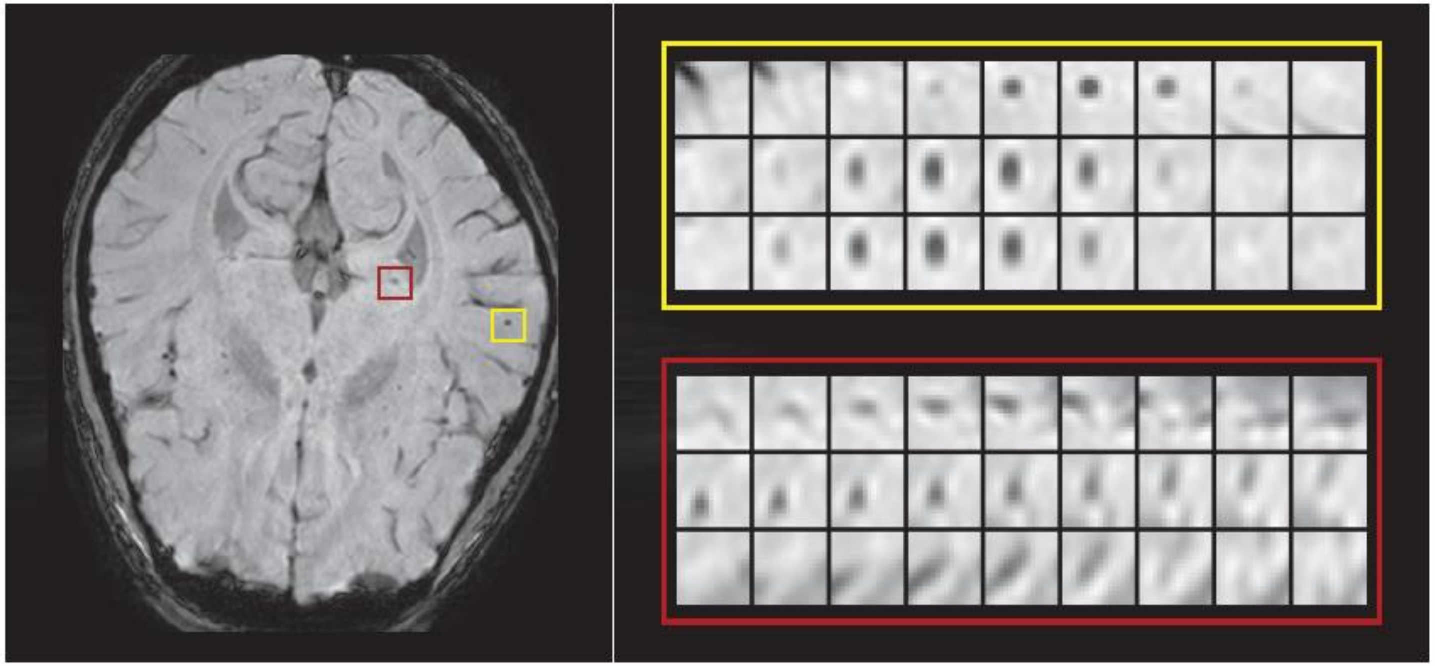
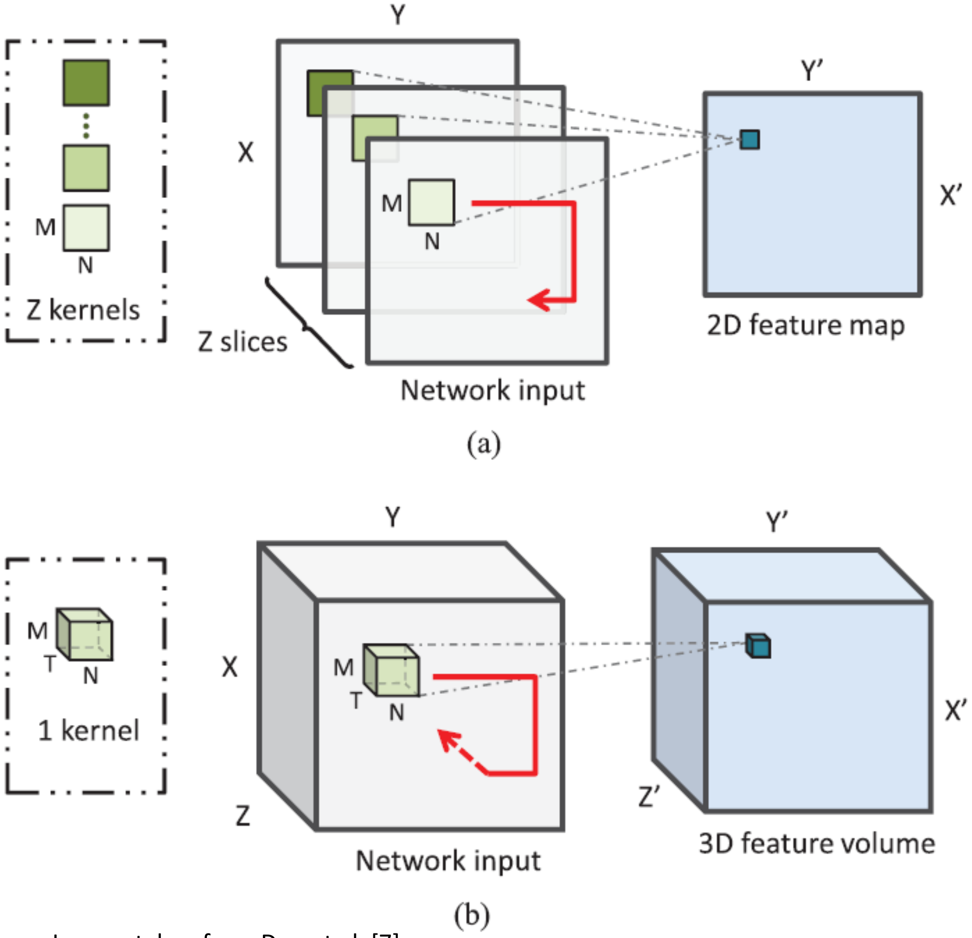


Roth et al. [6] colonic polyps, spine metastasis, enlarged lymphnodes from CT

Medical Applications – Pathology Detection

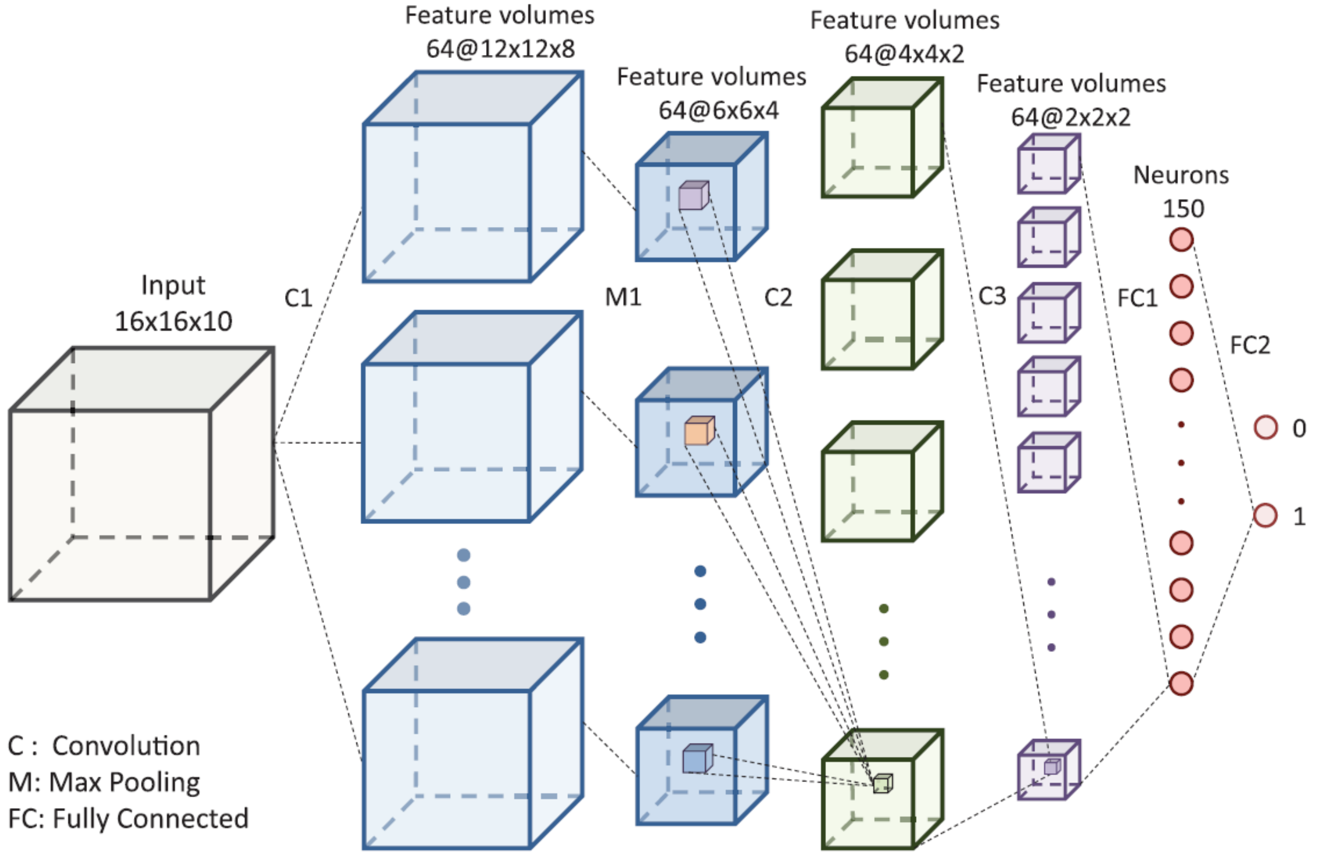
- 3D CNN

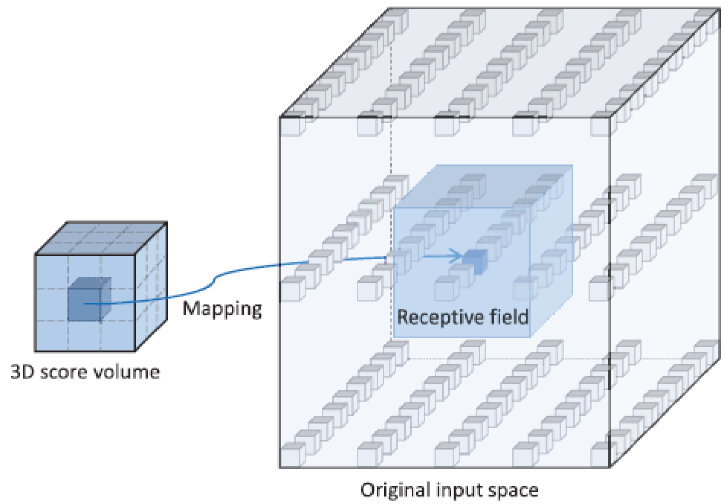


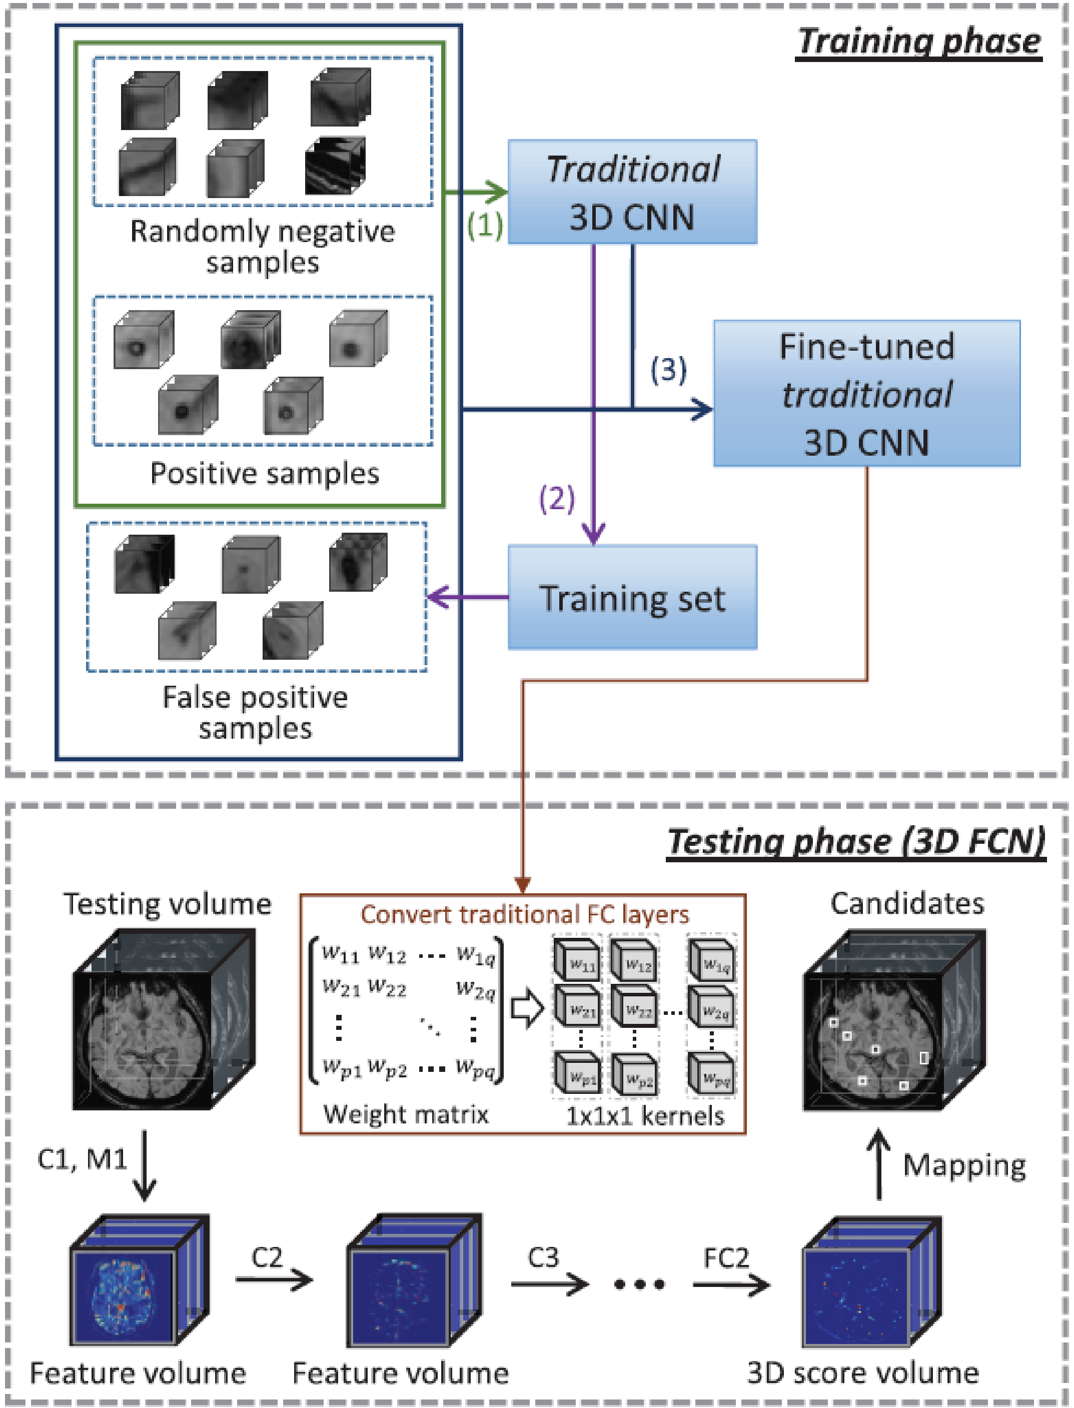


Images taken from Dou et al. [7]

Dou et al. [7] cerebral microbleeds MRI scans







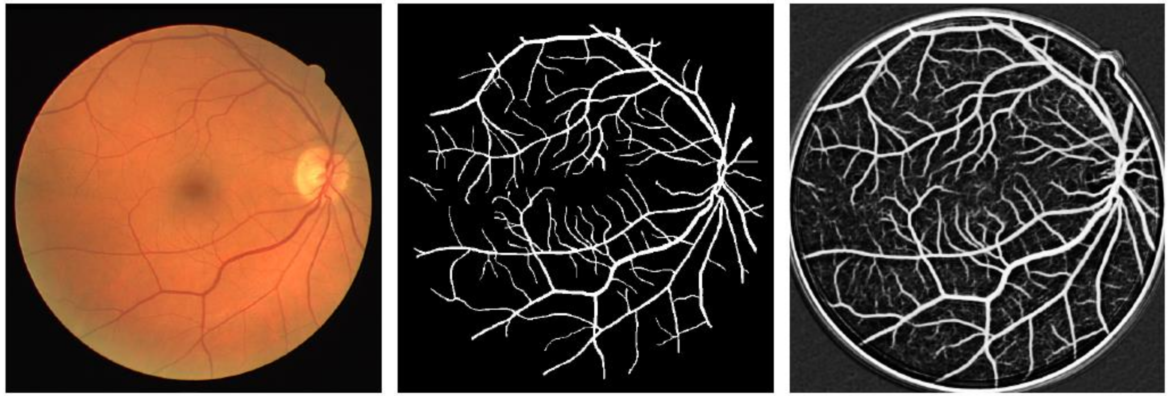
Images taken from Dou et al. [7]

Medical Applications

- Pathology Detection
- Segmentation and Shape Modelling
- Classification
- Action Recognition

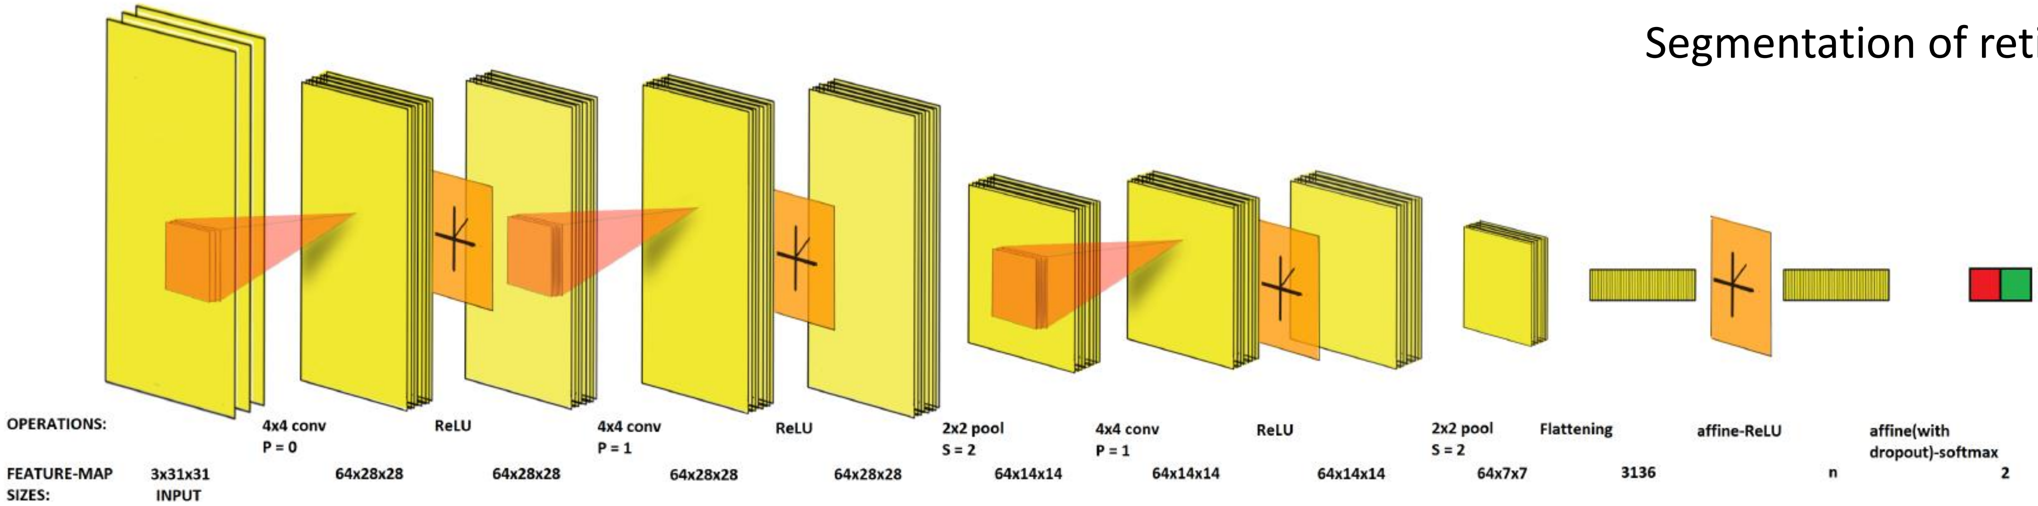
Medical Application - Segmentation

- Ensemble of Deep CNNs, 3D patches
- DRIVE database 40 images, 60K patches
- Independent training



(a) Fundus image (b) Ground truth (c) Detected vessels

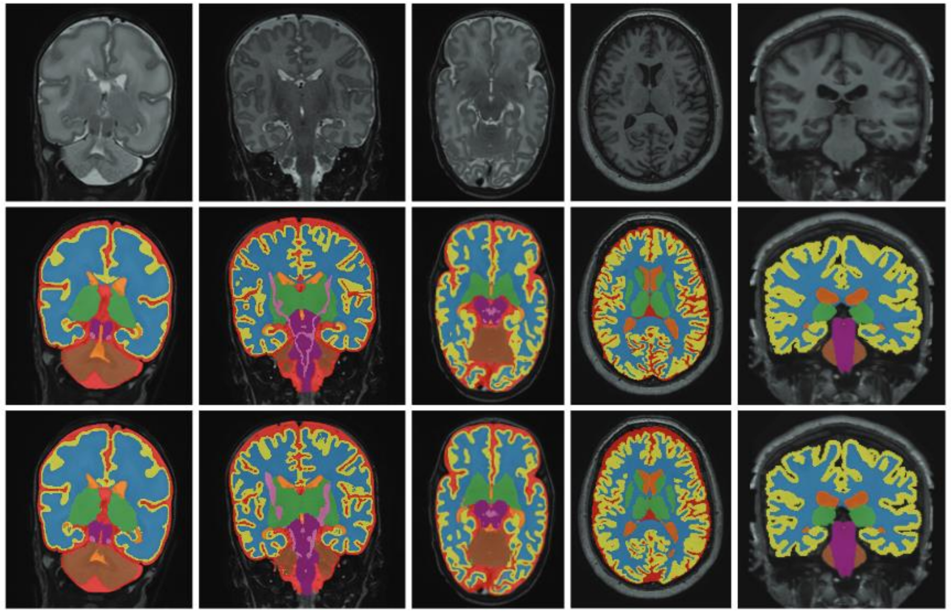
Segmentation of retinal vessels

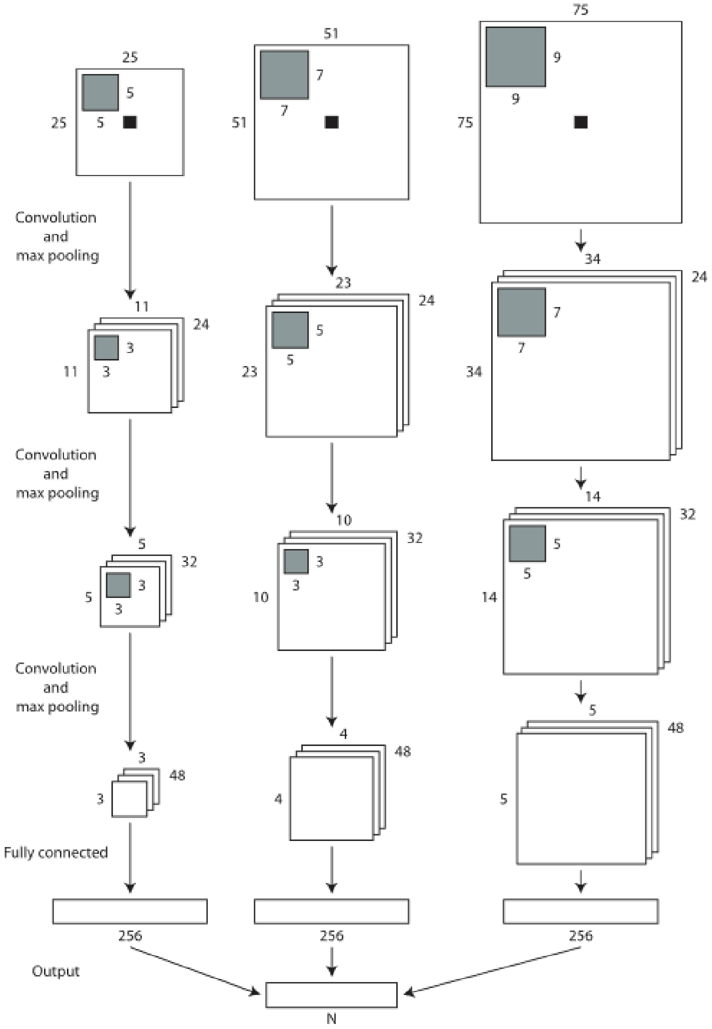


Maji 2016 [8] arXiv Retinal Vessel Detection

Medical Application - Segmentation

- Multi-Scale CNN
- 22 neonatal
- 20 ageing adult
- 15 young adults





Single soft max layer

Moeskops et al. [9] Brain segmentation

Medical Application - Segmentation

- Multi-Scale CNN

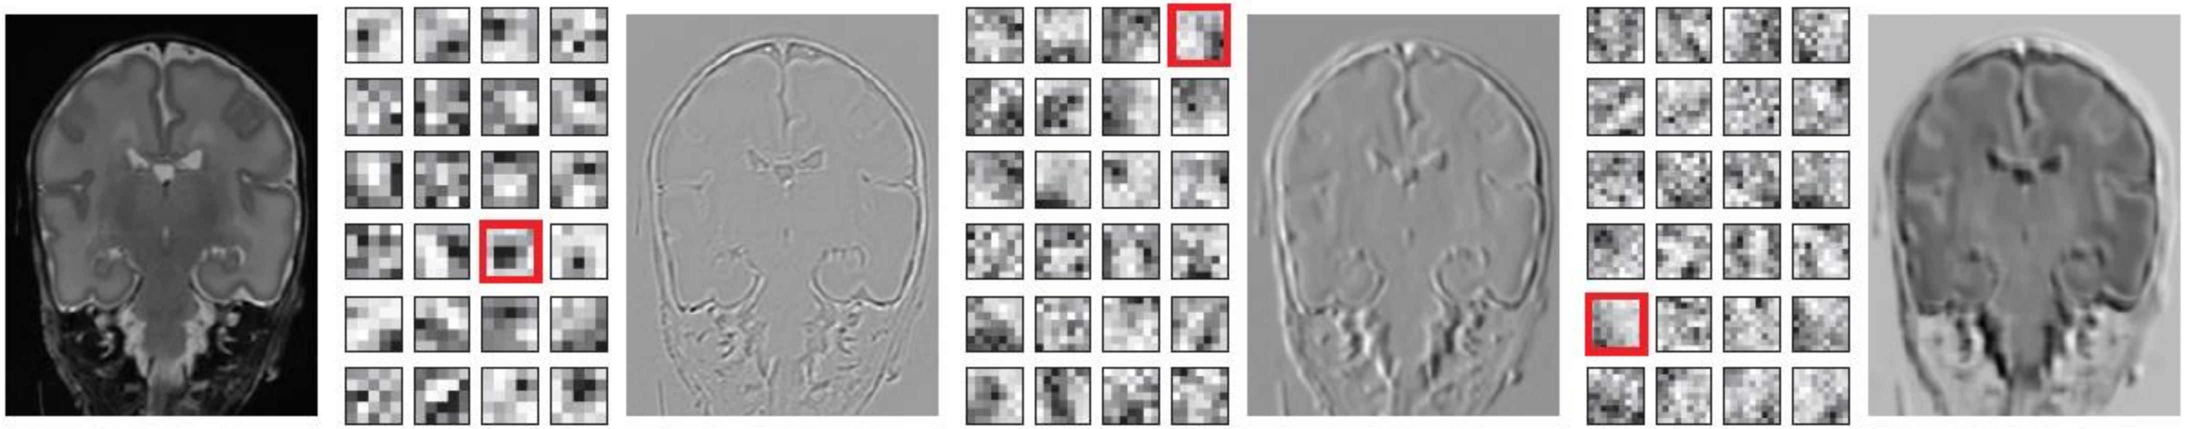


Fig. 2. Trained convolution kernels in the first layer after 10 epochs using the 5 training images acquired at 30 weeks PMA, and the kernels indicated in red applied to a test image. From left to right: the T_2-weighted test image, the kernels of 5×5 voxels, the image convolved with the indicated 5×5 kernel, the kernels of 7×7 voxels, the image convolved with the indicated 7×7 kernel, the kernels of 9×9 voxels, and the image convolved with the indicated 9×9 kernel.

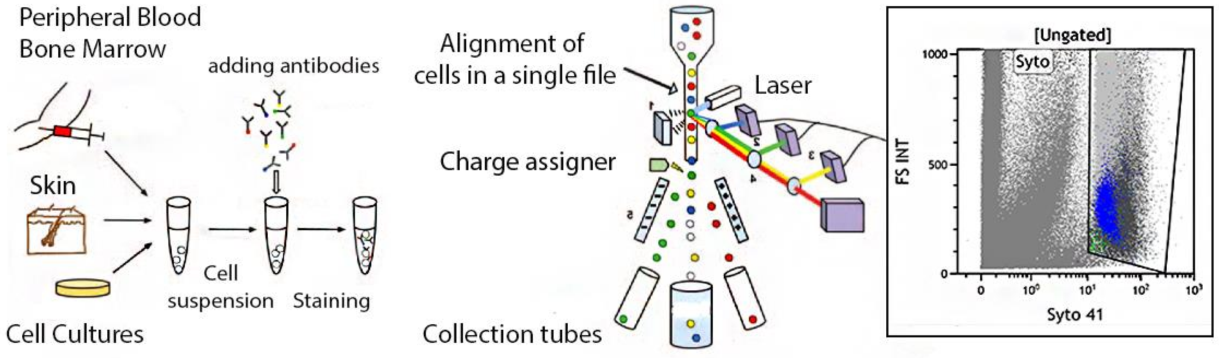
Moeskops et al. [9] Brain segmentation

Medical Applications

- Pathology Detection and Computer Aided Diagnoses
- Segmentation and Shape Modelling
- Classification
- Action Recognition

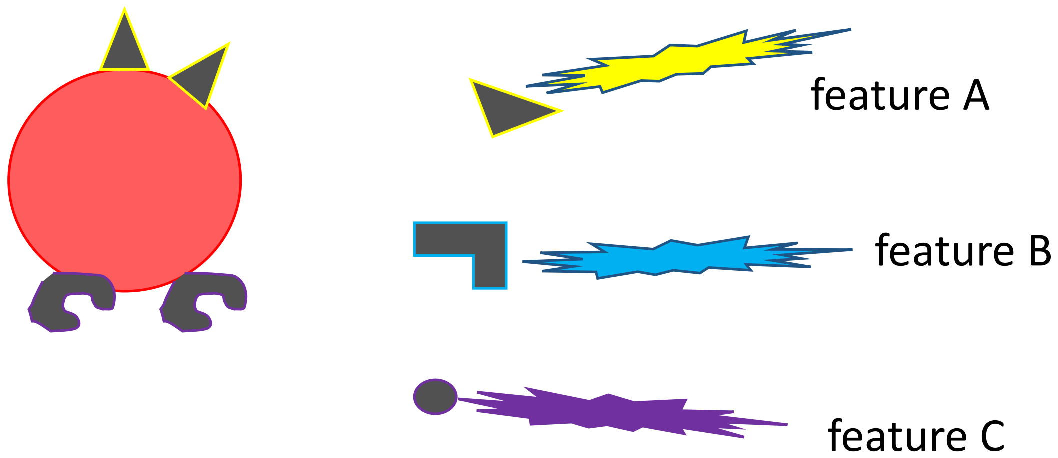
Medical Application - Classification

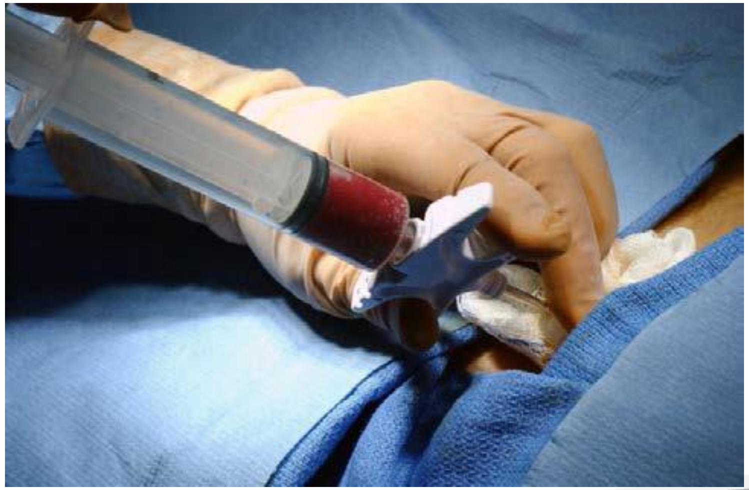
- Stacked layout of Auto-Encoders (SAE)
- Cell type specific antigen pattern
- 10^6 cells per patients
- 10 features



ANTIGEN (*Lock*) ANTIBODY (*Key*)

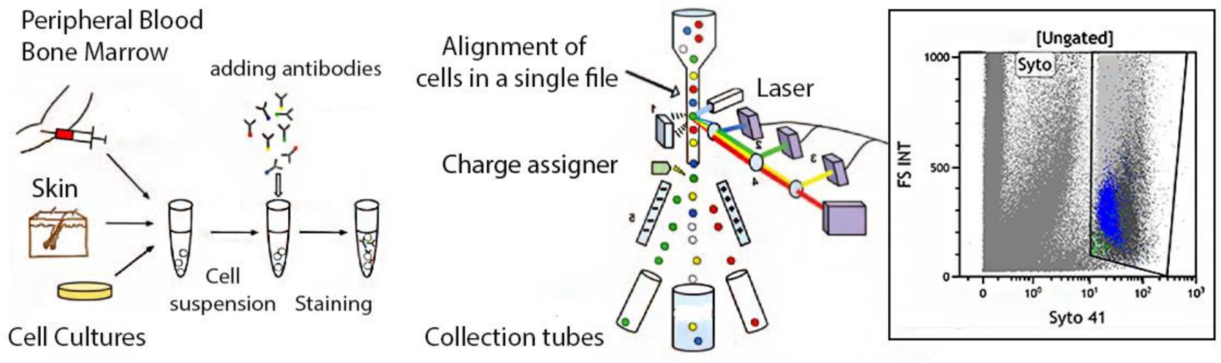
Blood cell

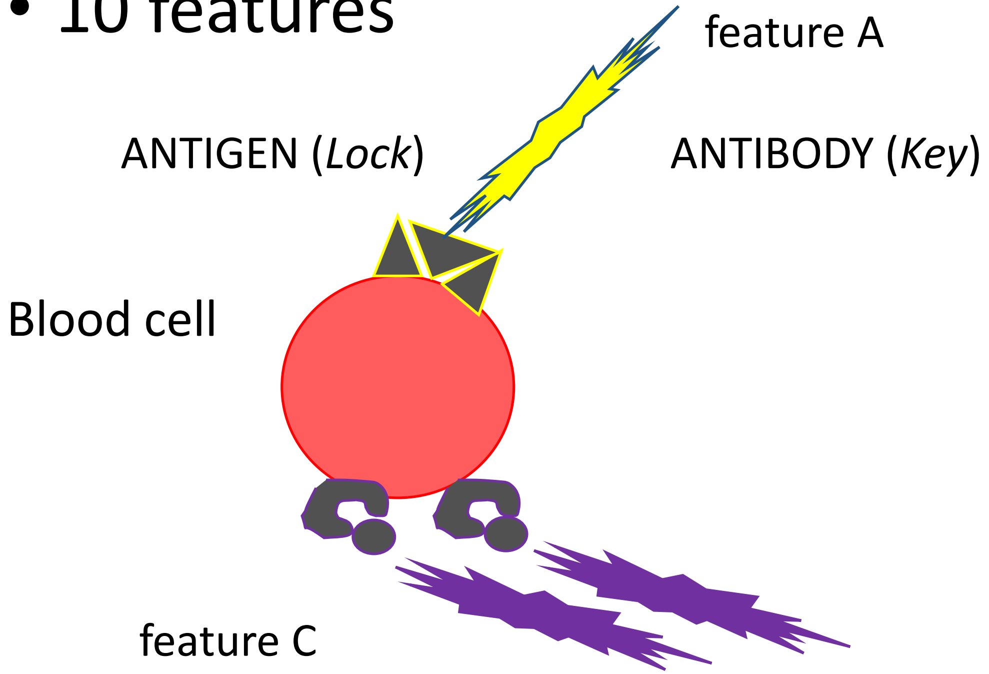


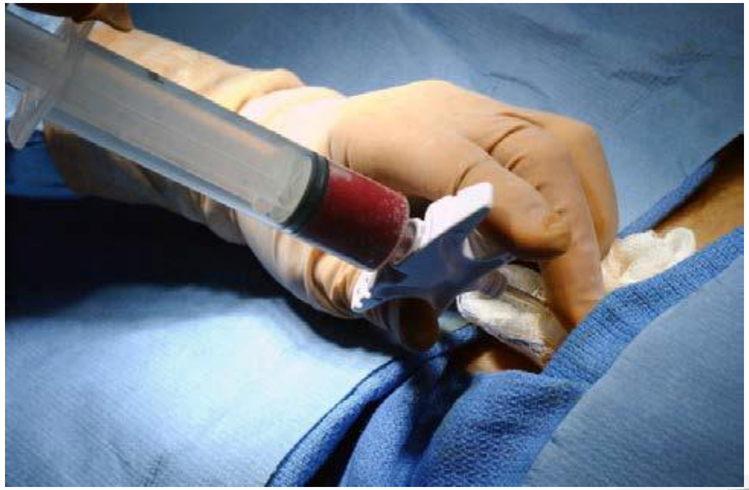


Medical Application - Classification

- Stacked layout of Auto-Encoders (SAE)
- Cell type specific antigen pattern
- 10^6 cells per patients
- 10 features

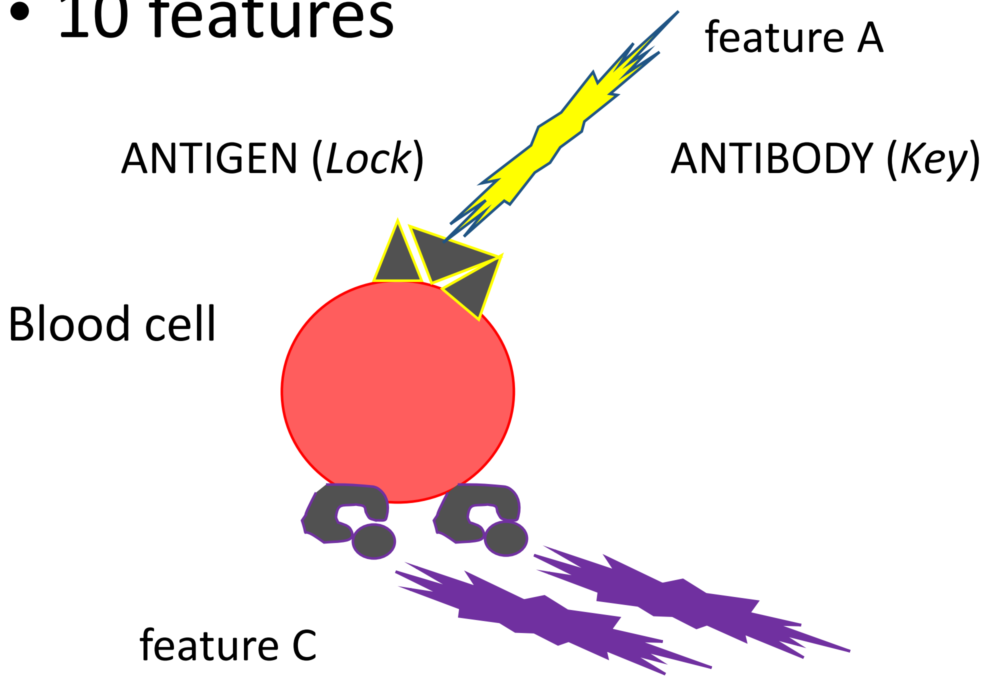


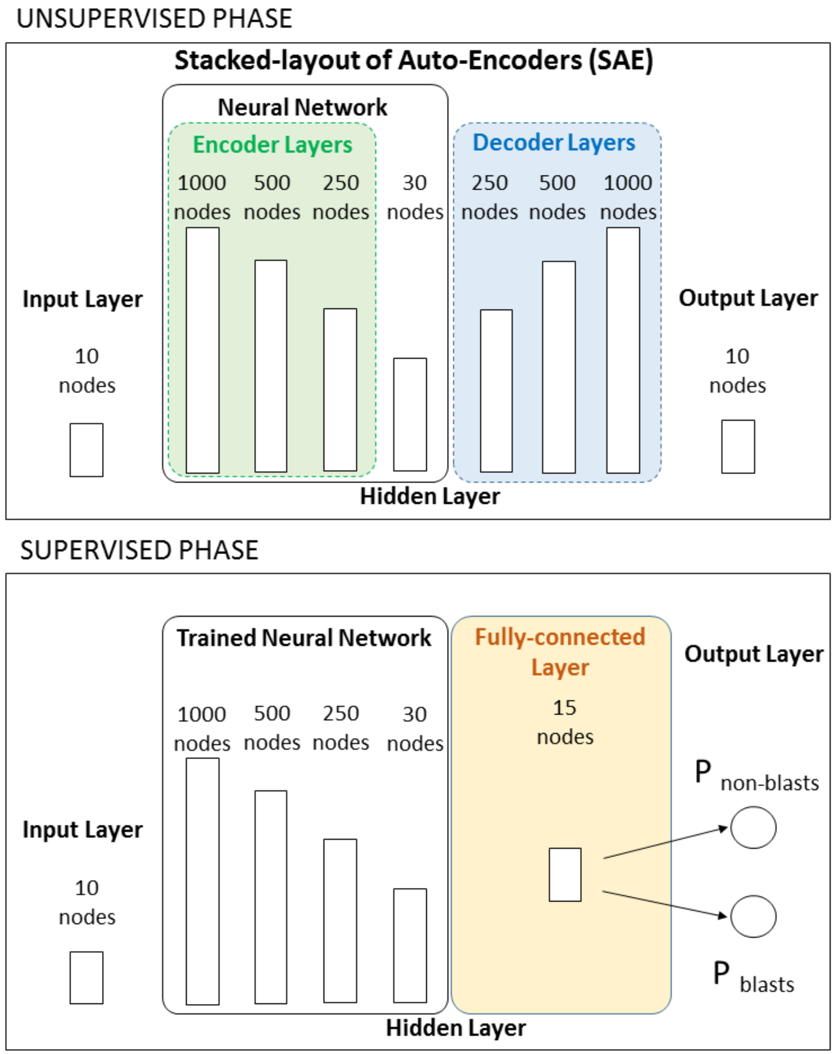




Medical Application - Classification

- Stacked layout of Auto-Encoders (SAE)
- Cell type specific antigen pattern
- 10^6 cells per patients
- 10 features





Licandro et al. CBMI 2016

Medical Applications

- Pathology Detection and Computer Aided Diagnoses
- Segmentation and Shape Modelling
- Classification
- Action Recognition

Medical Applications - Action Recognition

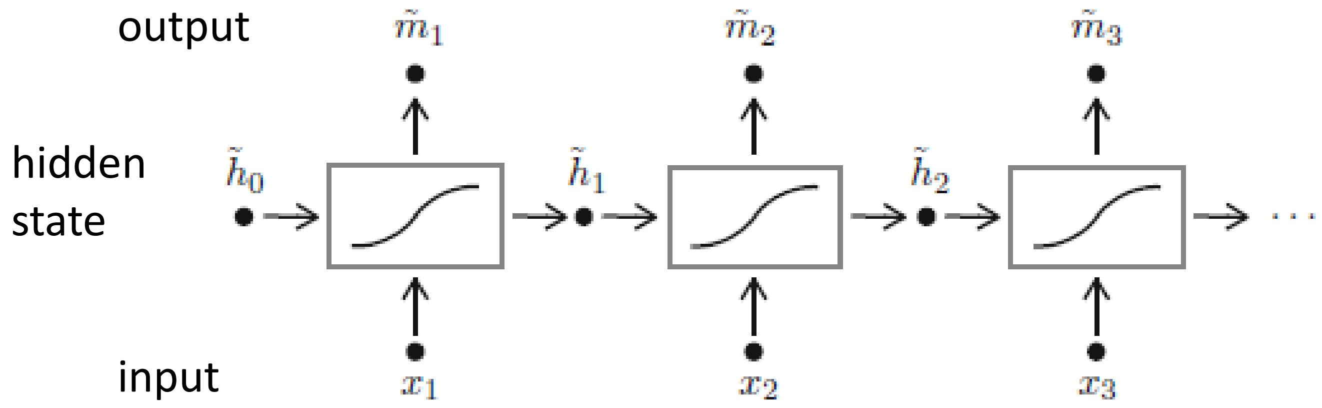
- Recognizing Surgical Activities using RNN
  - Kinematic signals over time (position, velocity, gripper angle)
  - Joint segmentation and classification of surgical activity (10 gestures)
  - JIGSAWS, MISTIC public benchmark surgical activity dataset (*da Vinci)*

DiPietro et al. [11]

SURGICAL ROBOT *Da Vinci* - http://www.robocatz.com/images/News-Da-Vinci-Surgical-Robot-5.jpg

Medical Applications - Action Recognition

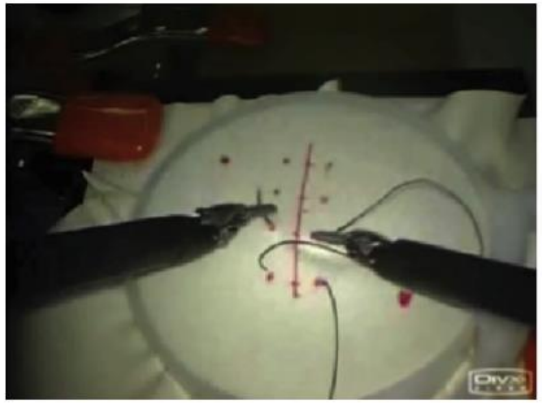
- Recognizing Surgical Activities using RNN
  - Kinematic signals over time (position, velocity, gripper angle)
  - Joint segmentation and classification surgical activity (10 gestures)
  - JIGSAWS, MISTIC public benchmark surgical activity dataset (*da Vinci)*



(a) A recurrent neural network.

DiPietro et al. [11]

Images take from [11] – JIGSAWS and MISTIC datasets



4-throw suturing task

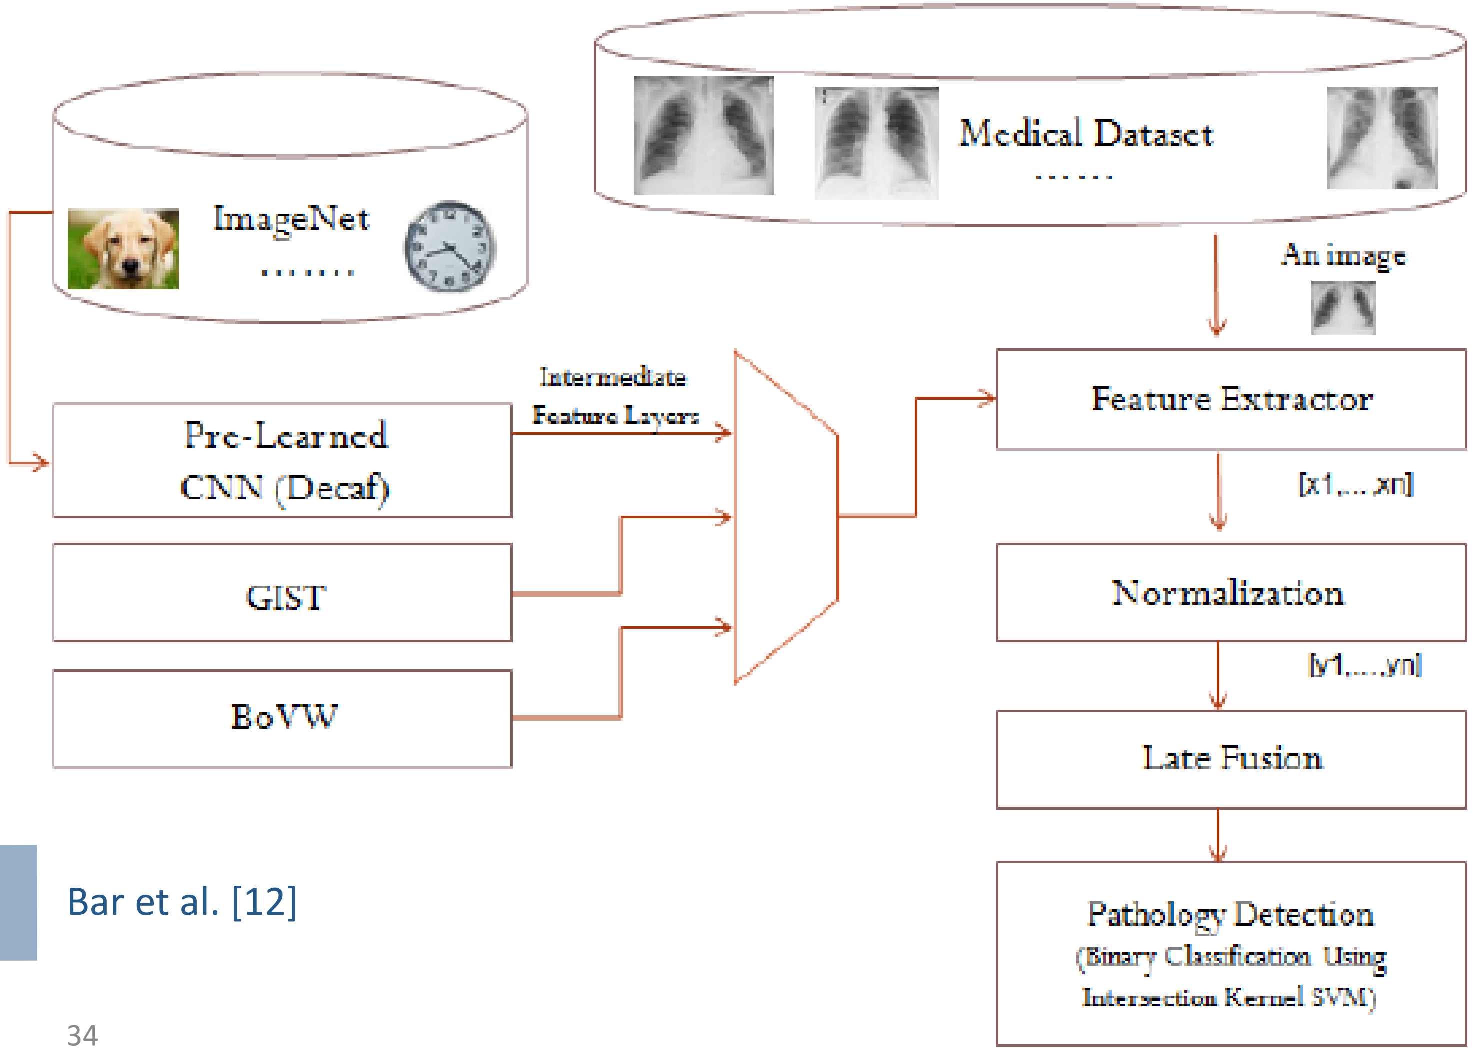
What can we do in cases were data are not available?

What are the key components to use deep CNNs in medical imaging applications?

Transfer Learning

- Supervised pre-trained CNN models used for a new medical task
- Data for pre-training
  - Different medical domain
  - Natural image dataset (e.g. ImageNet)
- Output extracted from layers considered as features
- Input to pattern classifier

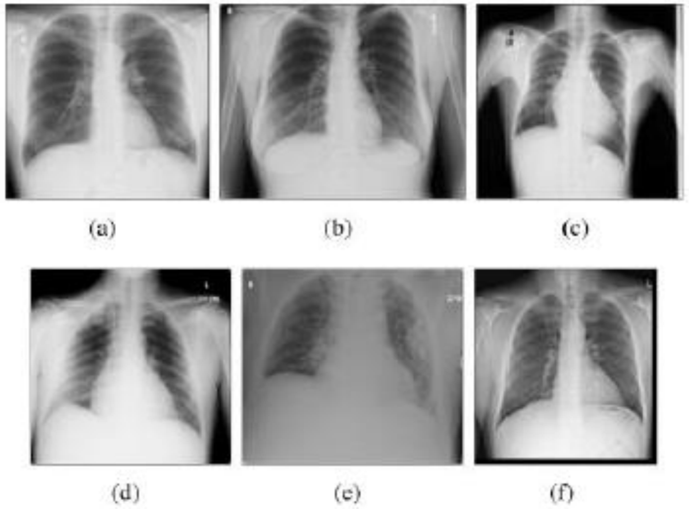
Transfer Learning



443 chest x-ray

Healthy

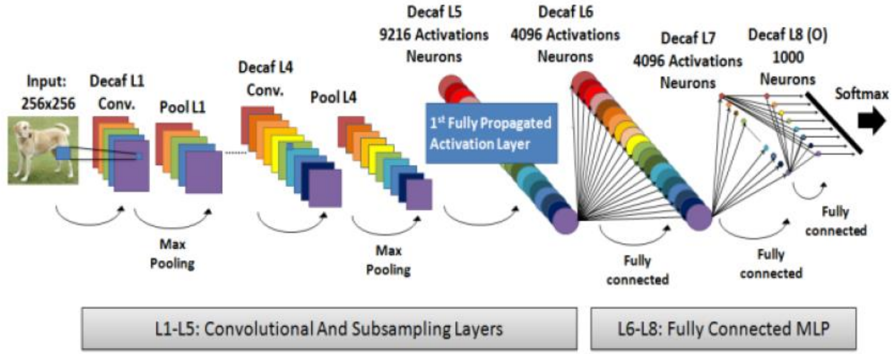
Enlarged heart



Decaf pre-trained CNN model

Subset of image from ImageNet

>1M images, >1K categories



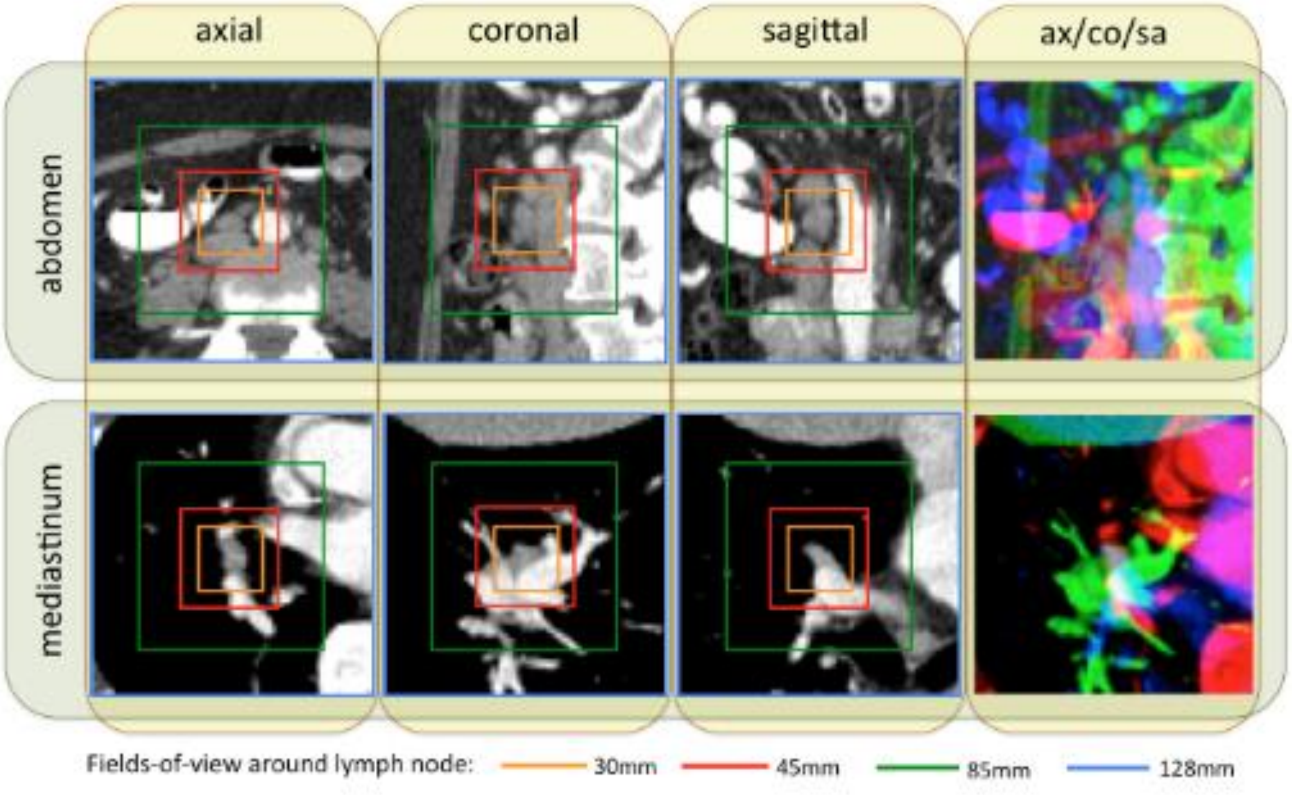
Bar et al. [12]

Fine Tuning

- Medium sized dataset exists for the task
- Pre-trained CNN used as initialization of the network
- Input of subsequent supervised training
- Deep fine-tuning, shallow fine-tuning Tajbakhsh et al. [13]

Fine-Tuning

- Thoraco-abdominal lymph node detection
- ImageNet pre-trained
- CifarNet, AlexNet, GoogLeNet
- Preprocess of input
- Adaptations
  - Pooling parameters
  - Filtersize
  - Stride parameters



Shin et al. [17]

Are there alternative methods for acquiring and annotating data?

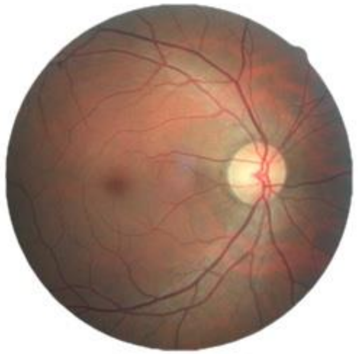
Expert vs. Non-Expert

- Annotation
  - Cost intensive
  - Time consuming
  - Lack of publicly available ground-truth data

- Crowdsourcing - Non Experts
  - Noisy annotations of single non experts
  - Disagreement between users
  - CNN – learning input from the crowds
  - Aggregation layer added
  - Crowd of nonprofessional, inexperienced users can perform as well as the medical experts [14, 15, 16]

Public available medical datasets

- VISCERAL http://visceral.eu/
- The Cancer Imaging Archive http://www.cancerimagingarchive.net
- Ongoing benchmark studies and challenges
  - http://www.grand-challenge.org
  - Precise definition of task to be solved is given
  - Evaluation metrics are defined
  - Standardized and fair comparison
- https://www.kaggle.com/c/diabetic-retinopathy-detection



Summary

- Evolution of Deep Learning in Medicine
- 2D/2.5D/3D CNN, Stacked Auto Encoder, Recurrent Neural Nets
- Accuracy of result important
- Most approaches are supervised
- Alternative to experts - crowdsourcing
- Transfer learning and training
- Trend torwards BigData, challenges at conferences, public data sets
